

NetControl for Windows

[[Order NetControl](#)] [[NetControl Download](#)] [[NetControl Details](#)]

NetControl permanently monitors and analyses the network (LAN) traffic and records the relevant parameters. This permanent supervision of the network enables you to react very quickly to upcoming problems. You can also determine and record the access to and from external stations:

- who (IP-addresses) uses your intranet
- with which IP service
- how much load was created
- which stations or servers were accessed

NetControl writes its data in HTML-files, you can view the information about your network with any web browser.

With the optional Accounting module *NetControl* can sum up the data of single users over any period of time and produce customer specific web pages.

- Saving and supervision of all network-relevant parameters like load, errors ...
- Building hitlists (Top Ten or Top 100) of the most active stations, most active broadcast-senders, IP-services, IP-networks, communication-matrix...
- Integration of NetFlow data
- Daily activity reports of the single stations.
- Automatic production of WebPages including generation and integration of graphics.
- Saving of long-term statistics over years (analysis of trends)
- Alarms (can start any program)
- Log reports

Options to fit NetControl to your network size:

NetControl version:	"Lite"	"Standard"	"Large"	"XLarge"	"Campus"
